Sampled Data for neural network training:

In order to benefit from the advantages of neural network, the data set used for training is required to have good number of feature variables with a descent number of samples for each variables. In this instruction, it has been tried to describe the several datasets for the training of neural network or other machine learning algorithms. From all datasets prepared for analysis, several datasets have only CGM-Insulin-carbs variables, there a small number of data sets with CGM-insulin-carbs-exercise variables, and the rest of datasets have CGM-insulin -exercise variables. Among these three groups, the most completed ones including all glycemic events are separated and are available in sub folder "CGM_Physical_Acivity-Meal". Another group of data sets containing CGM and physical activity variables are also separated and labeled in the sub folder "CGM-physical activity". The third subgroup of the data includes CGM and meal intake information with a large number of data sets available in the subfolder "CGM_meal". For CGM imputation purposes, 14 datasets are also separated with duration of 10-20 days of CGM values to test imputation techniques.

In what follows, a short description of feature variables is provided:

"Time": A continuous time-series variable generated by converting date-time to epoch time. This variable has been imputed and freed from outliers.

"IMPUTED": CGM values which are imputed by using cubic spline (up to 50 samples) and its outliers are also removed from the variable. This is continues time series variable.

"Denoised": Same CGM values with some smoothing and signal processing.

"DAY_WEEK": a discrete variable (with integer values from 1 to7) determining the day of the week that the data has been recorded.

"YEAR", "MONTH", "DAY", HOUR", "MIN", "SEC": extracted time-date variables suitable for classification purposes.

"BASAL": A continuous variable determining the rate of basal insulin is being injected. This variable is also imputed.

"bolus": the amount of bolus insulin administered after carbohydrate intake.

"Activity_Name": A categorical variable (an integer ranging from 1 to 40) determining the type of physical activity.

"Distance_value": The distance the patient has been walked (in mile).

"Activity_Duration": A sparse variable determining the duration of physical activity.

"insulinOnBoard": The calculated insulin on board values for suggesting insulin to be injected.

"insulinSensitivity": Insulin Sensitivity values.

"smbg_new": self-monitoring blood glucose concentration.

"nutrition_carbohydrate_net": The carbohydrates entered in a healthkit food entry.

"carb_input_new": the amount of consumed carbohydrate (in gram).

Following tables gives more specific information about the richness on the datasets:

Table 1. The summary of the samples available in each datasets in subcategory of 50 datasets. "1": descent number of samples; "0": sparse samples; "2": many samples.
